                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                           This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD*+binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                480

This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD^+-binding site and no zinc finger
sequence motif, of general formula Cx.2Cx_2Mx_2Cr.]. The nucleic acid
sequences. PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners as well as for determining their effectiveness.
C PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
collishing partners are useful for the disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP pareases playmerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

                                                                                                polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2MHX_2C (I). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               359

Murine PARP1 (long) homologue protein.

Þ

```
polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence with a functional NAD^+-binding site and no zinc finger sequences. PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 QALQAV-SEQEKTVEEVPHPLDRDYQLLKCQLQLLDSGAPEYKVIQTYLEQTGSNHRCPT 354

PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, meurological (e.g parkinsonism, meningitis-associated intracranial complications and isohaemia) / inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

This sequence represents human poly(ADP-ribose) polymerase (hPARP2).

This protein causes the covalent addition of polymers of ADP-ribose
to protein targets. hPARP2 activity is induced in many instances of
cotadative stress or during inflammation where there is direct damage
cotadative stress or during inflammation where there is direct damage
cot be used to treat a human having a disorder mediated by PARP2

activity, such as, inflammatory, neurological, cardiovascular,
cornenhagic shock, mycardial ischemia or infarction,
creabral vasospasm; rheumatoid, osteo- or gouty
arthritis, spondylitis; Behcet's disease; sepsis, septic or endotoxic
shock, gram negative or positive sepsis, toxic shock syndromes eccondary to septicemia, trauma, or hemorrhage;
altergic or vernal conjunctivitis, uveitis, thyroid-associated
cophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis,
allergic rhintis, ARBS, chronic obstructive pulmonary disease,
slicosis, pulmonary sarcoidosis, pleurisy, alveolitis, vasculitis,
allergic rhintis, and formation; atherosclerosis; systemic lupus
cornention, scar tissue formation; atherosclerosis; systemic lupus
cornentive colitis, inflammatory bowel disease, crohn's disease,
contentive colitis, incrotizing enterocolitis; inflammatory dermatoses,
contentive colitis, incrotizing enterocolitis; inflammatory dermatorses,
contentive colitis, incrotizing enterocolitis; inflammatory dermatorses,
contentive colitis, incrotizing enterocolitis; inflammatory dermatorses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             due to leukocyte dyscrasia and metastasis; thermal injury; granulocyte transfusion associated syndromes; and cytokine-induced toxicity. hPARP2 and antibodies to it, can also be used to diagnose these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   contact or atopic dermatitis, psoriasis, urticaria, fever and myalgias due to infection; meningitis, encephalitis, and brain and spinal cord

                                                                                                                                                                                                                                                                                                                                                AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; osteopathic; antiparkinsonian; nocircopic; neuroprotective; catalant; thrombolytic; campunosuppressant; nmunostimulant; cardiant; thrombolytic; campunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, grythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergias, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antilifiammatory disease; to enhance companed the properties and as a contraceptive.

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-Tibose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial arthritis) and dischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; isobhaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

PARP (Pol) (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gane expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial arthritis) and diabetes. The present sequence is a PARP protein, the cMA encoding which was used to design the antisense

                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD*+-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP2 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21;

Decretive, cerebroprotective, antiparkinsonian, nephrotropic, cardiant, vasotropic, anticonvollsant, cytostatic, antibacterial, cardiant, vasotropic, anticonvollsant, cytostatic, antibacterial, antidabetic. (I) are especially used for treating or preventing neurodegenerative disease or neuronal danage (specifically associated with ischemia, trauma or massive bleeding, especially apoplexy or spinal-cranial trauma or Alzheimer's disease, Huntington's disease or parkinson's disease), treating or preventing ischemic damage (specifically renal damage after renal ischemia or during and after kidney transplantation or heart damage after cardiac ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. temporal lope on complex partial attacks), treating microhifaction (e.g. during and heart transplantation), revascularization of critically constricted coronary arteries (e.g. temporal late of carding and heart transplantation), revascularization of critically constricted coronary arteries (e.g. leg arteries), treating anchemia and damage during on the feet the mechanical or by-pass operations) or peripheral arteries (e.g. leg arteries), treating anchemia and damage during on the feet the mechanical or dury-induced lysis and treating and inverse and complex partial attack microhifactions) or peripheral arteries or experience or after microhifaction (e.g. leg arteries), treating anchemia and damage during the constitution of critically carding and the mechanical constitution or described for or defined the mechanical constitution or described for or defined the constitution or described for defined the constitution or des
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              their metastasis, sepsis and septic shock, inflammatory and rheumatic disease (e.g. rheumatoid arthritis), and diabetes mellitus. Although (I) inhibit PARP (i.e. the known form designated PARPI), they especially selectively and strongly inhibit PARP homologs, specifically the homolog PARP2. In particular (I) have very strong PARP2 inhibitory activity (e.g. with K.i values of 1-20 nM) and high selectivity for PARP2 relative to PARPI (generally by a factor of more than 5).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |||||||| :|||| | : : | : | |||||| : : ||| gkgiyfadmssksanycfasr--lkntgllllsevalgqcnelleanpkaegllggkhst 502

This sequence represents a mover numen boury car. This sequences with at least 95% identity to the shipARRS2 variants and sequences with at least 95% identity to the shipARRS2 variants and sequences with at least 95% identity to the shipARRS2 variants and sequence; expression systems and host cells comprising an shipARRS2 nucleic acid sequence; the recombinant expression of shipARRS2; and an antibody specific for shipARRS2 shipARRS2 proteins of nucleocides are useful as vaccines for inducing an immunological response in a mammal. The shipARRS2 protein is useful for identifying compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of shipARRS2 are useful for treating human diseases including ischaemia and ischaemic tissue injury (e.g., cerebral and cardiac ischaemia, myocardial infarction, stroke), inflammation, and cardiac ischaemia, myocardial infarction, stroke), inflammation, cautoimmune disease (e.g., diabetes, multiple sclerosis) and neurodegenerative diseases (e.g., parkinson's disease and Alzheimer's disease). shipARS2 nucleic acids are useful as diagnostic reagents for detecting muterions in the associated gene; as hybridisation probes to isolate full-length shipARS2 colks and sbhPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 genomic clones; and for chromosome localisation atudies are also useful in screening methods for detecting the effect of added compounds on the production of mRNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20;

                                                                                                                                                                   poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) properties. The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polyvucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
                                     Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonuclectide complementary

to the complementary strand of a polynuclectide which comprises one of

the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprises a 5'-end

sequence of sequence 3'-end sequence, where the

oligonucleotide which comprises at 15 nucleotides and the combination of

the 5'-end sequence 3'-end sequence; selected from those defined in

the specification. The primer sets can be used in antisense therapy and

in gene therapy. The primers are useful for synthesising polynucleotides,

contingent of alagnosis of the abnormality of the full-length cDNAs. The primers are also useful for the

contact of an and oligonosis of the abnormality of the full-length cDNAs as asily without any specialised methods. AAH13629 and

AAH13633 to AAH18742 represent human cDNA sequences; and AAH13629 to AAH13622

contact the contact of the contact Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 6, Al

SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

K -> N (IN REF. 2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE-Kidney;
Ansorge W., Wirkner U., Mewes H.-W., Gassenhuber J., Wiemann S.;
Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor -
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Widely expressed; the highest levels are in the kidney, skeletal muscle, liver, heart and spleen; also detected in pancreas, lung, placenta, brain, leukocytes, colon, small intestine, ovary, testis, prostate and thymus.
-!- SIMILARITY: BELONGS TO THE PARP FAMILY.

                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor-
nicotinamide + {ADP-D-ribosyl}(N+)-acceptor.
SUBCELLULAR LOCATION: NUCLEAR (By similarity).
ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be
produced by alternative splicing.
TISSUE SPECIFICITY: WIDELY EXPRESSED. THE HIGHEST LEVELS ARE IN
THE BRAIN, HEART, PANCRESS, SKELETAL MUSCLE AND TESTIS; ALSO
DETECTED IN KIDNEY, LIVER, LUNG, PLACENTA, OVARY AND SPLEEN:
LEVELS ARE LOW IN LEUKOCYTES, COLON, SMALL INTESTINE, PROSTATE AND

TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.
-!-CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!-COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!-SUBCELLULAR LOCATION: Nuclear.
-!-ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A

TISSUE SPECIFICITY: EXPRESSED IN ADDIF FEMALE OCCYTES, ANAL PLATES OF STAGE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM IN LATER EMBRYOS.

DEVELOPMENTAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY IN SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.

EMBRYOS, PUPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.

MISCELLANDOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN
SIMILARITY: BELCONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation—the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 INTERACTION WITH THE MAJOR VAULT PROTEIN.
nuclear protein PH5P of the inter-alpha-inhibitor superfamily: a
 PROTEINS OF 193 AND 240-kba.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE NUCLEUS, ASSOCIATED WITH MITOTIC SPINDLES.

-!- TISSUE SPECIFICITY: WIDELY EXPRESSED; THE HIGHEST LEVELS ARE IN THE KIDNEY; ALSO DETECTED IN HEART, PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, SPLEEN, LEUKOCYTES AND PANCREAS.

-!- SIMILARITY: CONTAINS 1 BRCT DOMAIN.

-!- SIMILARITY: CONTAINS 1 WAFA DOMAIN.
 inter-alpha-inhibitor family and a novel actor of DNA repair?";
FEBS Lett, 446:6-8(1999).
-!- CATALYTIC ACTIVITY: NDC+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!- SUBUNIT: BINDS TO THE MAJOR VAULT PROFEIN (MPV). THE VAULT, A LARGE RIBONUCLEOPROTEIN COMPLEX, CONTAINS THE 100-kDA MPV AND

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 This invention describes novel human and murine poly(ADP-ribose)

polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD^+-binding site and no zinc finger
sequence motif, of general formula CX.ZCX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners as well as for determining their effectiveness.
Dinding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
chuman PARP3 protein used in the method of the invention.

The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, mentological (e.g. parkinsonism, meningitis-associated intracranial complications and ischaemia) , inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
clisease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
murine PARPI protein used in the method of the invention.

 The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribosa) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, meurological (e.g parkinsonism, menhigitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,
 cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; mentingitis-associated intracrantal complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-Tibose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, menhigitis-associated intracranial complications and ischaemia) inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

 This invention describes novel human and murine poly(ADP-ribose) polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD⁺+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2MXZ_C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying pARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or isofhemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP2 protein used in the method of the invention.

 poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) polymerase. PRARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme; the NAP polymucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence. The complementary to the oligonucleotide which comprises a 1'-end sequence of an equence of 3'-end sequence of a sequence of complementary to a polynucleotide comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the chetcin and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers also also as a sequence of a AAH13628 and AAH13613 to AAH13613 to AAH13629 to AAH13629 contents and a complement of a page of sequences; and AAH13629 to AAH13629 contents and a complement of a page of sequences; and a page of a certain and animo acid sequences; and a the exemplification and a page of a complement of a page of a pag
 Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs .

 CATALYTIC ACTIVITY: NAD ACCOUNT.

COTALYTIC ACTIVITY: NAD ACCOUNT.

COFACTOR: SINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

COFACTOR: SINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

SUBGLILLIAM LOCATION: Nuclear.

MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE Z'-POSITION OF
THE TERMINAL ADENOSINE MOLETY, BUILDING UP A POLYMER WITH AN
 MEDLINE-88151954; PubMed-2450019; Taniguchi T., Yamauchi K., Yamamoto T., Toyoshima K., Harada N., Taniguchi T., Takahashi S., Yamamoto H., Fujimoto S.; "Depression in gene expression for poly(ADP-ribose) synthetase during the interferon-gamma-induced activation process of murine macrophage tumor cells.";
 FUNCTION: POLY(ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

 SHORT FORM: ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: EXPRESSED IN ADULT FEMALE OCCYTES, ANAL PLATES
OF STAGE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM
 IN LATER EMBRYOS.

IN LATER EMBRYOS.

EMBRYOS, PUPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.

MISCELLANEOUS: THE ADD-FIBOSTL GROUP OF NAD(+) IS TRANSFERRED TO
 AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELE, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.
 PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT
ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT
CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND
 -i- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}{(N)-acceptor = nicotinamide + {ADP-D-ribosyl}{(N+1)-acceptor. -i- COFACTOR: ZINC. CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN. -i- SUBCELLULAR LOCATION: Nuclear. -i- SUBCELLULAR LOCATION: Nuclear. -i- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
 TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.
Hanai S., Uchida M., Kobayashi S., Miwa M., Uchida K.; "Genomic organization of Drosophila poly(ADP-ribose) polymerase and distribution of its mRNA during development."; J. Balol. Chem. 273:11881-11886(1998).
 -i- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDI

 missing link between poly(ADP-ribose)polymerase and the inter-alpha-inhibitor family and a novel actor of DNA repair?"; FEBS Lett. 446:6-8(1999).

C -!- CATALYTIC ACTIVITY: NDC+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

C -!- SUBUNIT: BINDS TO THE MAJOR VAULT PROTEIN (MPV). THE VAULT, A LARGE RIBONUCLEOPROTEIN COMPLEX, CONTAINS THE 100-kDA MPV AND 2 PROTEINS OF 193 AND 240-kDA.

C -!- SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE NUCLEUS. SPECIFICITY: MIDELY EXPRESSED; THE HIGHEST LEVELS ARE IN THE XIDNEY; ALSO DETECTED IN HEART, PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, SPLEEN, LEUKOCYTES AND PANCREAS.

C -!- SIMILARITY: BELONGS TO THE PARP FAMILY.

C -!- SIMILARITY: CONTAINS I VWFA DOMAIN.
 INTERACTION WITH THE MAJOR VAULT PROTEIN.
